

WishMe

Introduction and Objectives

WishMe is a web application that allows users to create, view, and reserve wishlists. The main goal of the project is to provide a convenient and secure way to share personal wishes with others, while maintaining control over one's own list and allowing others to reserve items.

Project Features

- User registration and login with "remember me" support
- CRUD operations for wishes (create, edit, delete)
- Image upload for each wish
- User search by username and viewing their wishlists
- Reserving and unreserving wishes
- Color marking and styling based on reservation status
- Protection against reserving one's own wishes

Database ER Diagram

Tables:

- User: id, username, password_hash
- Wish: id, name, category, amount, image, user_id (FK), reserved_by_id (FK)

Relationships:

- One user has many wishes
- Each wish can be reserved by another user (or by no one)

Code Structure

Blueprint Organization

- auth: routes for authentication/registration
- wishlist: routes related to wishes, search, and reservations

Object-Oriented Programming (OOP)

- User and Wish — SQLAlchemy model classes
- User loading mechanism via user_loader
- Forms implemented using WTForms (inheriting from FlaskForm)

Issues and Solutions

1. User variable was not displayed in template

Solution: Passed viewed_user variable in render_template.

2. Missing add wish button

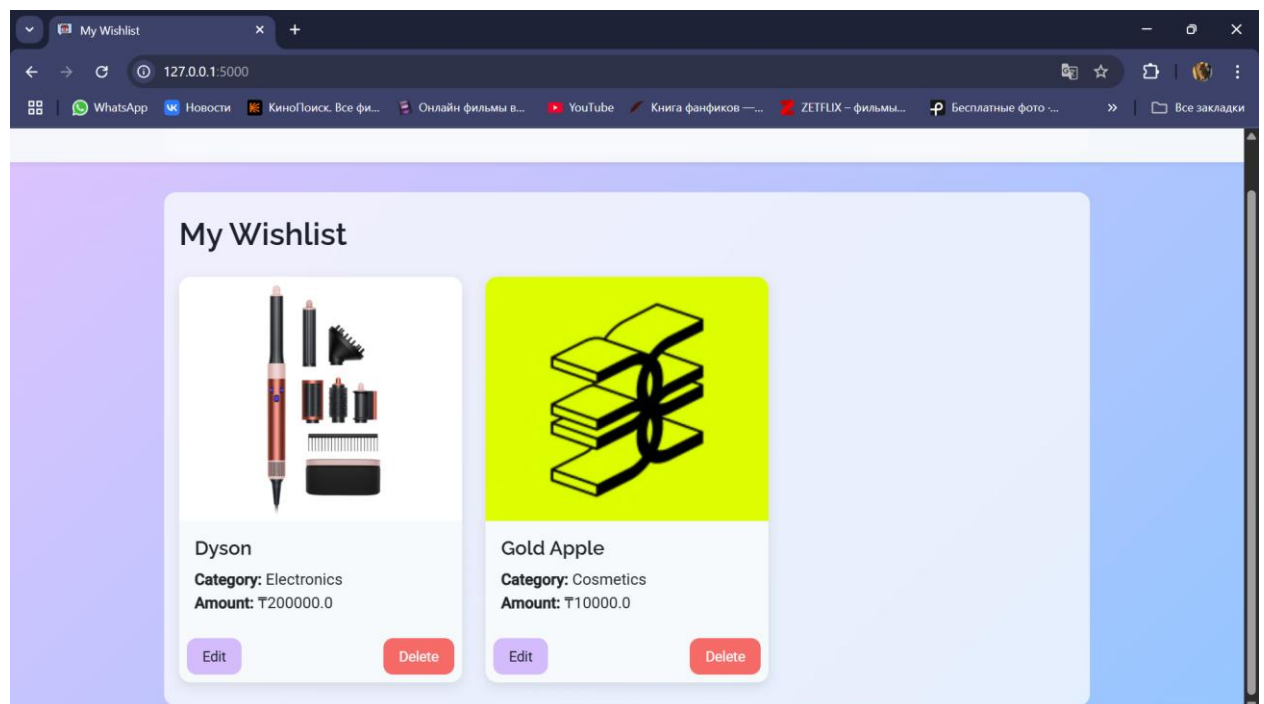

Solution: Added the button to base.html with current_user.is_authenticated check.

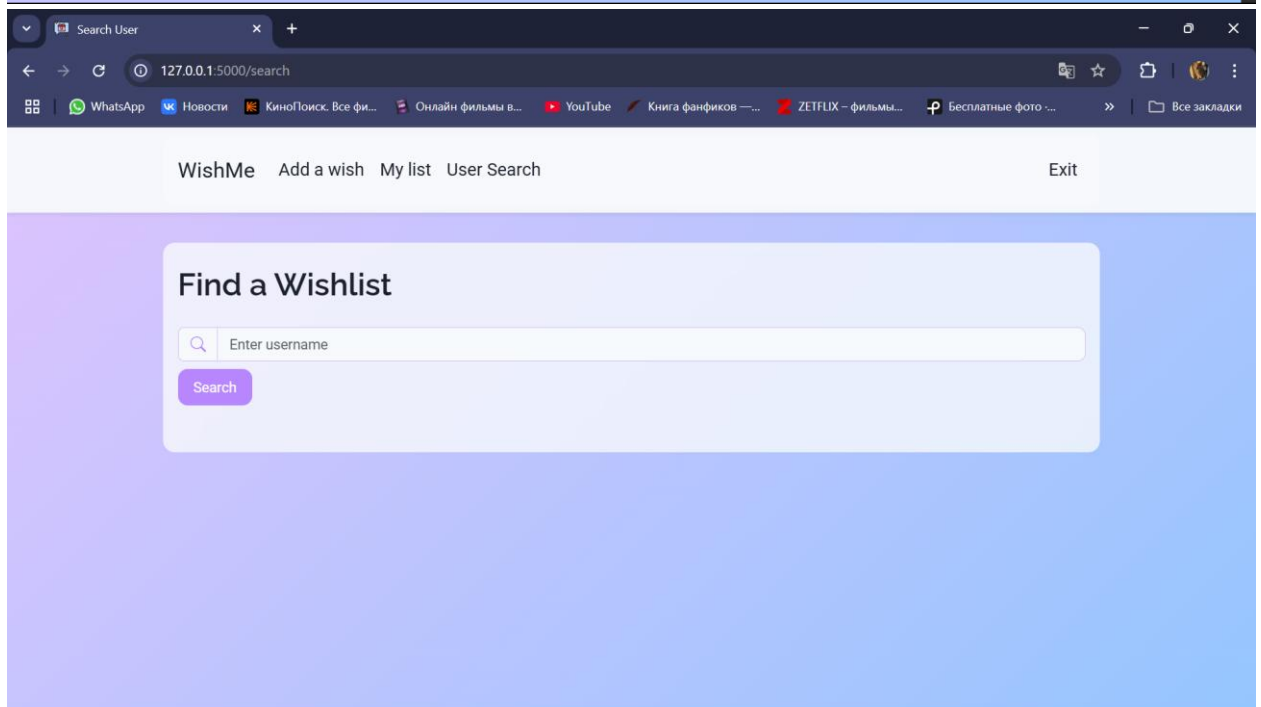

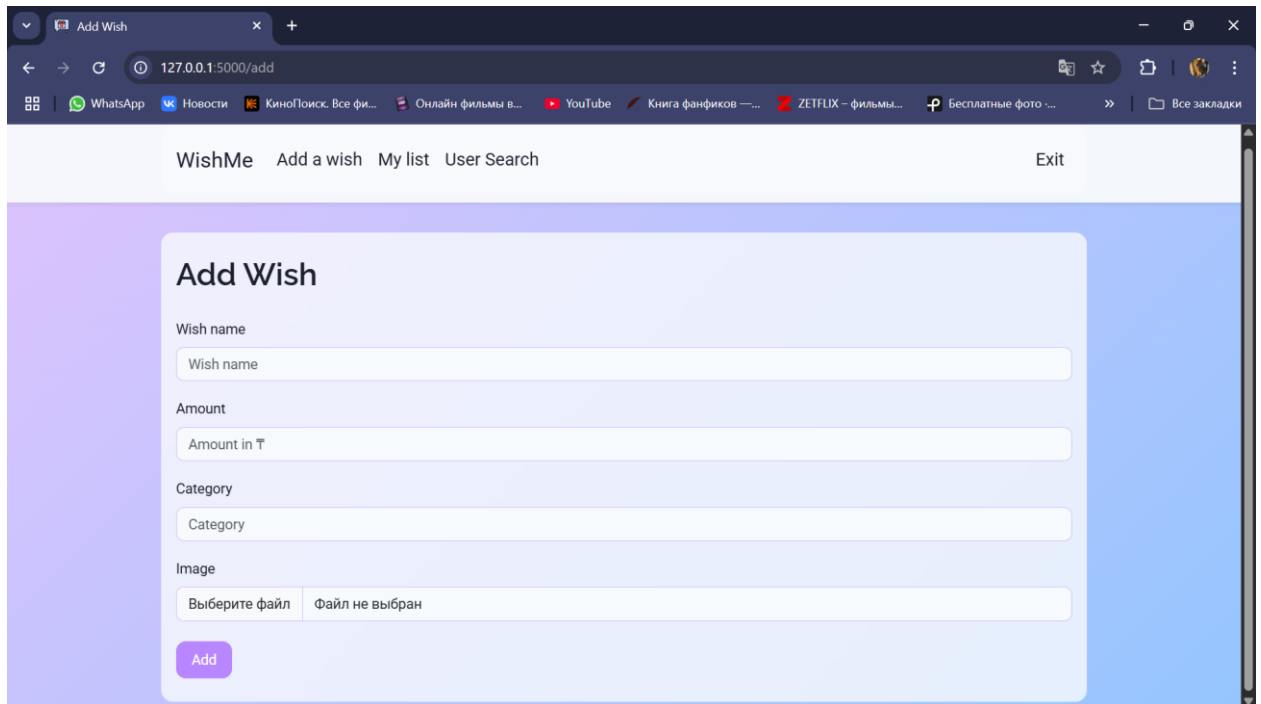

3. Image upload handling

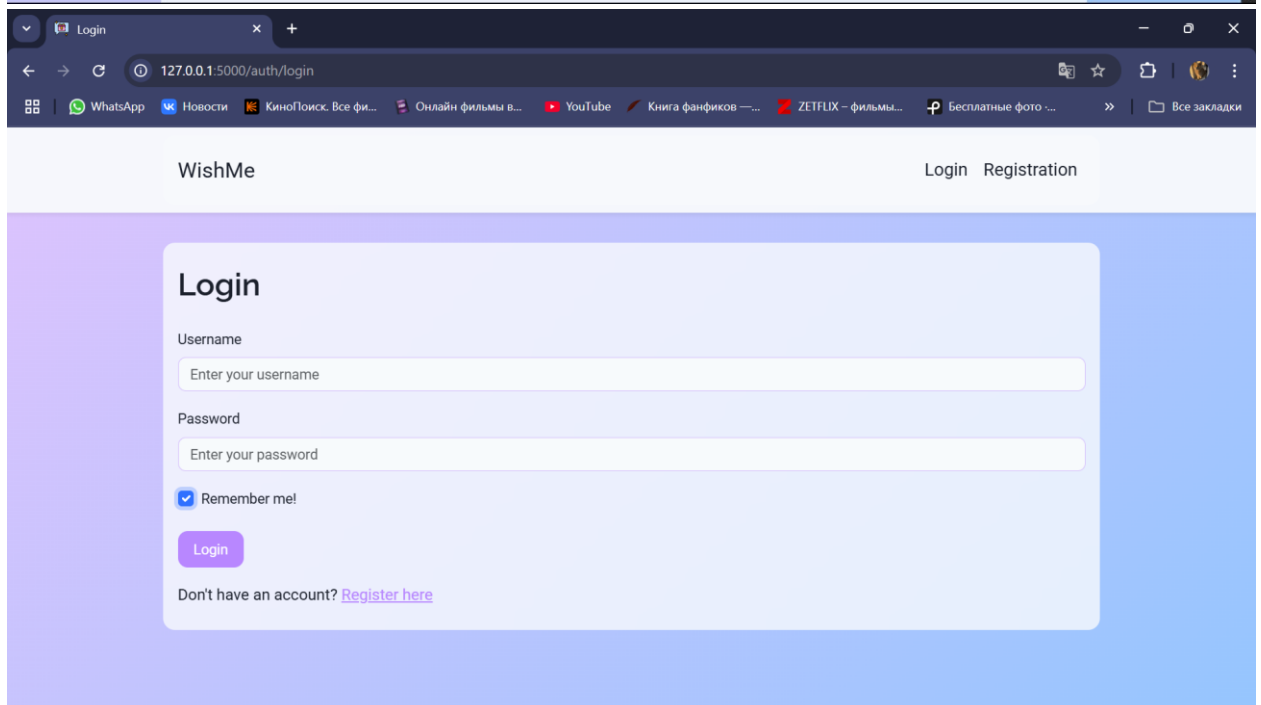

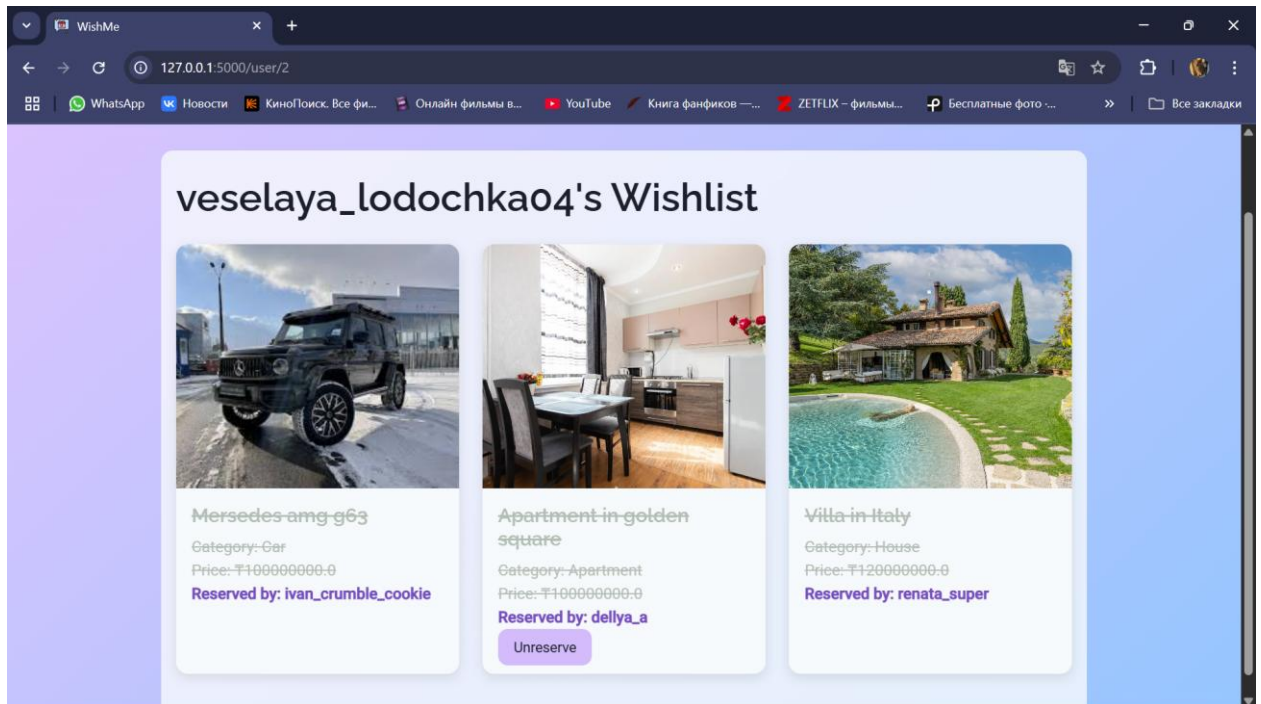

Solution: Used secure_filename and saved to static/uploads directory.

4. Protection against reserving one's own wishes

Solution: Added a check wish.user_id == current_user.id before reserving.
